ASD_publicationA new publication, the HIV test–treat–retain cascade analysis: guide and tools, has been developed to support national AIDS programme managers and their partners to implement the HIV test–treat–retain cascade analysis at country level.

It includes guidance on how to use the cascade model to assess the magnitude and determinants of engagement along the continuum of care and also opportunities to improve the delivery of services to people living with HIV/AIDS and, ultimately, access to HIV testing and treatment.

It suggests a process for conducting the cascade analysis in country in order to achieve broad stakeholder participation, consensus on the findings of the analysis and ownership of the conclusions and recommendations for improvements resulting from it.
