23 February 2015 | Geneva - Use of the same syringe or needle to give injections to more than one person is driving the spread of a number of deadly infectious diseases worldwide. Millions of people could be protected from infections acquired through unsafe injections if all health-care programmes switched to syringes that cannot be used more than once. For these reasons, the World Health Organization (WHO) is launching a new policy on injection safety and a global campaign with support from the IKEA Foundation and Gavi, the Vaccine Alliance, to help all countries tackle the pervasive issue of unsafe injections.
