20 September 2020, Cairo, Egypt -- The World Health Organization is grateful for a generous donation of US\$ 1 million from the Qatar Fund for Development to support its

ongoing work in Sudan for a period of one year. The agreement is part of a larger, joint project that brings together the Qatari Red Crescent and Qatar Charity to support

vulnerable populations in Sudan, in coordination with the Federal Ministry of Health and WHO.

"Sudan's health system suffers from years of underfunding, lack of staff, human resources, medicines, materials, equipment and medical supplies," said Dr Ahmed Al-Mandhari,

WHO Regional Director for the Eastern Mediterranean. "Recent flooding in Sudan has also led to an increased risk of vector- and water-borne diseases, requiring strengthened

disease surveillance and coordination. COVID-19 has also created additional challenges for the health system. WHO hopes that the successful implementation of this pilot project

will result in a long term cooperation to strengthen the emergency preparedness and response on federal and state level in the entire country."

As part of the project, WHO will build the capacity of the health workforce on emergency response in the three priority states of While Nile, Kassala, and Sennar, and will increase

the coverage of sentinel sites reporting on diseases in White Nile State. WHO will also establish and equip a reference laboratory in White Nile State for more effective diagnosis

and response to disease outbreaks.

The project will strengthen coordination on federal level through the strengthening of emergency operations centres and emergency standard operating procedures, as well as the project will strengthen coordinate on the project will strengthen the strengthening of emergency operations centres and emergency standard operating procedures, as well as the project will strengthen the strengthening of emergency operations centres and emergency standard operating procedures, as well as the project will strengthen the strengthening of emergency operations centres and emergency standard operating procedures, as well as the project will be a strengthening of emergency operations centres and emergency standard operating procedures, as well as the project will be a strengthening of emergency operations and the project will be a strengthening of emergency operations and the strengthening of emergency operations are also as the project will be a strengthening of emergency operations and the strengthening of emergency operations are also as the strengthening operations and the strengthening operations are also as the strengthening operations

strengthening capacity of the health workforce at all levels.

The project will also address the main pillars of emergency preparedness by strengthening the surveillance system and laboratory in White Nile state, strengthening infection

prevention and control and isolation in health structures, and improving case management capacities, health promotion and rapid response teams in White Nile State.

According to the 2020 UN Health Needs Overview for Sudan, more than 8 million people need humanitarian health assistance, of which 5 million people are targeted for

humanitarian health interventions. Natural disaster such as the ongoing floods, repeated outbreaks of vector, waterborne and vaccine preventable diseases, in addition to the

COVID-19 pandemic, are overwhelming an already fragile health system. Health service delivery and emergency response is further affected by the ongoing socioeconomic crisis.
