

30 July 2023 – The World Health Organization (WHO) congratulates Iraq for having eliminated trachoma as a public health problem, making it the fifth country in WHO’s Eastern Mediterranean Region to achieve this milestone.

“The success of Iraq’s national trachoma programme has shown what can be achieved with national leadership and collaboration”, said Dr Tedros Adhanom Ghebreyesus, WHO Director-General. “Freedom from trachoma will positively impact the lives of the most vulnerable populations now and in the future”.

Iraq established its national trachoma programme in 2012 to coordinate the final domestic push against the disease. A trachoma surveillance system was developed to detect and manage cases within secondary and tertiary eye care facilities, as well as through school pre-enrolment and school eye screening programmes conducted in collaboration with the Ministry of Education. Thousands of refractionists, optometrists, ophthalmologists, specialist eye surgeons and other trained healthcare staff contributed to these efforts.

Post-elimination, Iraq and WHO will continue to closely monitor previously endemic areas to detect and if necessary, combat any resurgence of disease.

“WHO has validated Iraq as having eliminated trachoma as a public health problem, making it the eighth country in the Eastern Mediterranean Region that has eliminated at least one neglected tropical disease” said Dr Ahmed Al-Mandhari, WHO Regional Director for the Eastern Mediterranean. “This is a remarkable achievement, and it illustrates that with dedication countries can achieve success in eliminating diseases, even under challenging circumstances.

Iraq's success in eliminating trachoma is also a true demonstration of our regional vision of Health for All by All."

Trachoma, the leading infectious cause of blindness worldwide, is still known to be endemic in six countries of WHO's Eastern Mediterranean Region, but there has been substantial progress in the number of people in the region requiring antibiotic treatment for trachoma elimination purposes, which has fallen from 39 million in 2013 to 6.9 million in April 2023.

Global progress

Globally, Iraq joins 17 other countries that have been validated by WHO for having eliminated trachoma as a public health problem. These are Benin, Cambodia, China, Gambia, Ghana, Islamic Republic of Iran, Lao People's Democratic Republic, Malawi, Mali, Mexico, Morocco, Myanmar, Nepal, Oman, Saudi Arabia, Togo and Vanuatu.

Iraq is also the 50th country to be acknowledged by WHO for eliminating at least one neglected tropical disease (NTD), globally. This major milestone is the halfway mark to the 100-country target set for 2030 in the [WHO road map for neglected tropical diseases](#) . Since the beginning of 2023, 5 other countries have successfully completed the relevant validation processes for one NTD.

"The contribution that NTD programmes are making towards universal health coverage is impressive as by definition they extend outreach to pockets of underserved populations" said Dr Ibrahim Socé Fall, Director, Global NTD Programme, WHO. "Thanks to Iraq's dedication and commitment, the world is now closer to attaining the Sustainable Development Goals targets".

Note to the editor

Trachoma is a neglected tropical disease. It is caused by infection with the bacterium *Chlamydia trachomatis*, which spreads from person to person through contaminated fingers, fomites and flies that have come into contact with discharge from the eyes or nose of an infected person.

Environmental risk factors for trachoma transmission include poor hygiene, overcrowded households, and inadequate access to water and sanitation.

To eliminate trachoma as a public health problem, WHO recommends the SAFE strategy[1]: a comprehensive approach to reduce transmission of the causative organism, clear existing infections and deal with their effects.

[The 2021–2030 neglected tropical disease road map targets the prevention](#), control elimination and eradication of 20 diseases and disease groups by 2030. Progress against trachoma and other neglected tropical diseases alleviates the human and economic burden that they impose on the world's most disadvantaged communities.

[1] The SAFE strategy consists of: Surgery to treat the blinding stage (trachomatous trichiasis); Antibiotics to clear the infection, particularly mass drug administration of the antibiotic azithromycin, which is donated by the manufacturer, Pfizer, to elimination programmes, through the International Trachoma Initiative; Facial cleanliness; and Environmental improvement, particularly improving access to water and sanitation.
