Figure 1 Comparison between Eastern Mediterranean Region countries and the rest of the world according to testing frequency

Note: Kruskall-Wallis test was used. $P$-value=0.008 for incidence rates (higher cases/million were associated with higher testing frequency); $P$-values non-significant for mortality ($P=0.289$) and fatality rates ($P=0.193$) between EMRO countries. Case fatality rate significantly different between high testing countries and worldwide average ($P<0.001$).
