

Table 3 Distribution of the power of 2 formulas in predicting birth weight > 4000 g

Formula	Sensitivity % (CI)	Specificity % (CI)	Positive predictive value % (CI)	Negative predictive value % (CI)
Fundal height × abdominal girth ^a	81.3 (80.2–82.4)	82.2 (81.2–83.2)	99.5 (99.5–99.5)	86.0 (81.0–91.0)
Regression model of birth weight on fundal height ^b	75.0 (73.7–76.3)	85.4 (84.5–86.3)	99.4 (99.4–99.4)	95.0 (89.0–100.0)

^aCut-off point = 3900 g; ^bCut-off point = 3450 g.

CI = confidence interval.
