Trends in cases by age distribution and dehydration status

Figure 2d | Trend in proportion of cases aged under 5¹

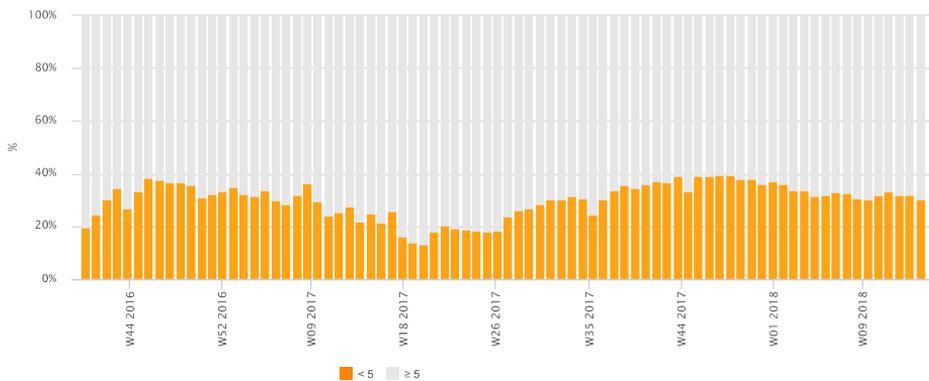

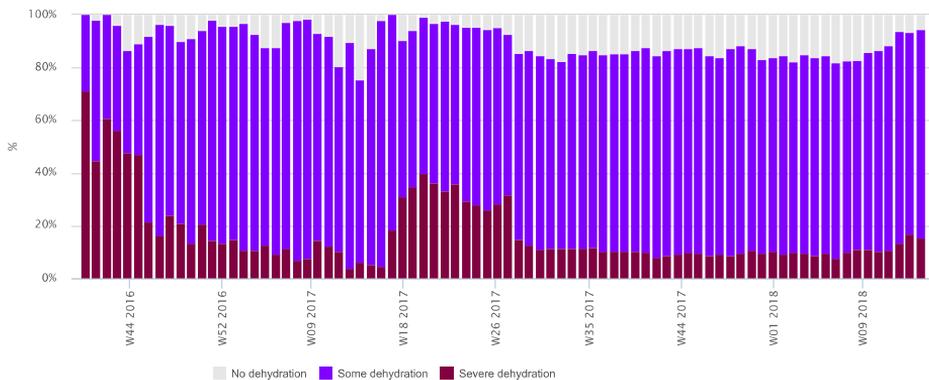

Figure 2e | Trend in proportion of cases by dehydration status¹

¹ Trends in proportional age distribution and dehydration status always add up to 100% and do not give any indication of the number of cases reported. For this reason, these may reflect cases that are not visible in the epidemic curve due to the scale of the y-axis and the huge difference in the case counts between the first and second waves of the outbreak.
