Serious problems in measles reporting in one DoH

Gray shading measles surveillance need to be strengthened.

Yellow shading suspect current measles transmission; 4 DoH reported 12 cases but blood sample were collected and investigation form was received for only 4 cases. The remaining cases were diagnosed

**Annualized data

Red shading past intense measles transmission, Total confirmed measles= Total suspect measles-discarded. All notified cases without clinical, lab or Epi link are considered as confirmed.

Table (2) Cumulative measles/rubella case finding report up to week 11 year 2011

Province	Total population	Measles case finding report						Rubella case finding report

** This figure represents lab confirmed + EPI linked + clinical measles.

*** This figure represents non-measles suspect cases/100,000 population.

EMRO definition of complete investigation = district + age + sex + drash + vaccinfo (1 or 2) + DLM + MEASLES1 (1 or 2 or 3) if spec collected.

Red shading measles intense transmission is suspected, there is a need for urgent steps to improve routine measles coverage.

Yellow Shading Indicator not met.

Wasit; Salahaddin; Muthana; have clear week measles surveillance indicators.

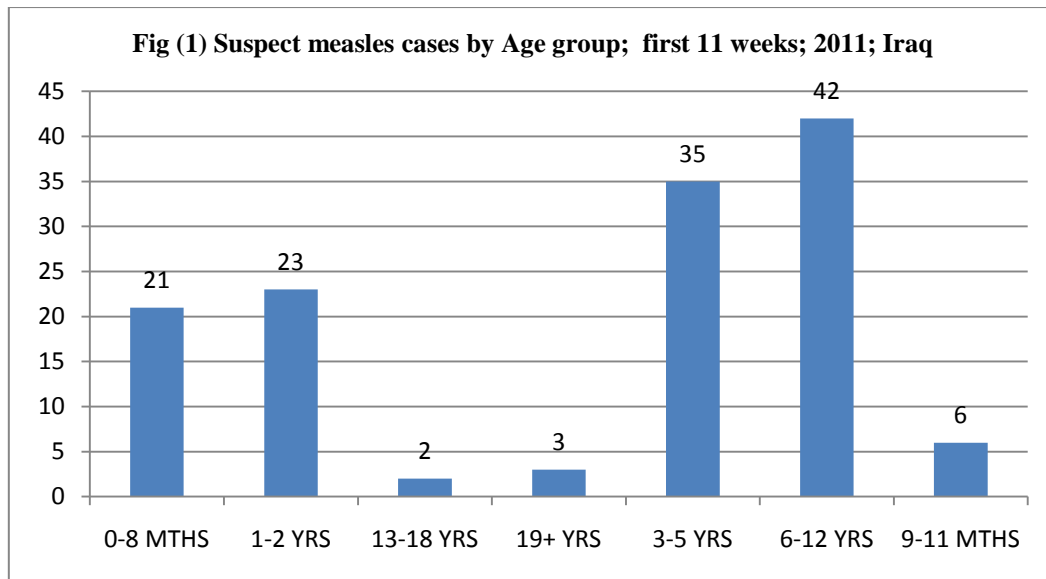

Fig (1) shows that 21% of suspect measles cases are still occurring among infants below the age of 8 months, while 84% of suspect measles cases occur in the age group below 5 years of age. MoH has completed an H to H immunization national campaign to immunize children 6 months to 3 years of age using mono-valent measles vaccine. The good news is that there are only 2 laboratory confirmed cases. All cases that have specimens 131 were found negative by NML except 2. However; for the 16 cases, no specimens were collected and the investigation was not adequate, therefore, they were considered as clinically positive; which points to several weaknesses in the surveillance system in the 7 provinces that did not collect specimen nor sent a complete case investigation form.

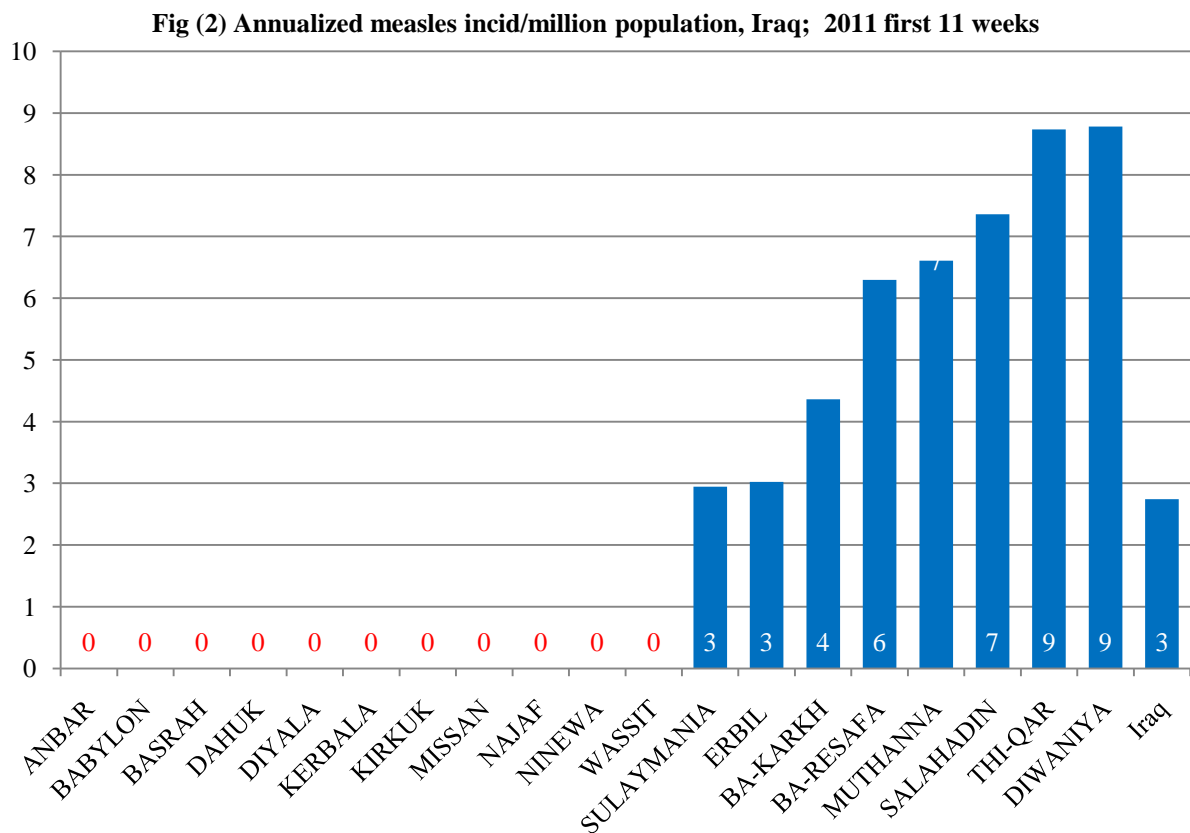

Fig (2) shows the 7 DoH in which measles transmission is considered as still ongoing; all cases were clinically diagnosed since the 7 provinces were not able to collect blood specimens from the cases. It must be mentioned

that all cases (131) for which specimens were collected, tested negative to measles and rubella IgM except for the 2 cases that were positive from Diwanyaia.

Fig (3) Annualized non-measles rate /100,000 population ; 2011 first 11 weeks; Iraq

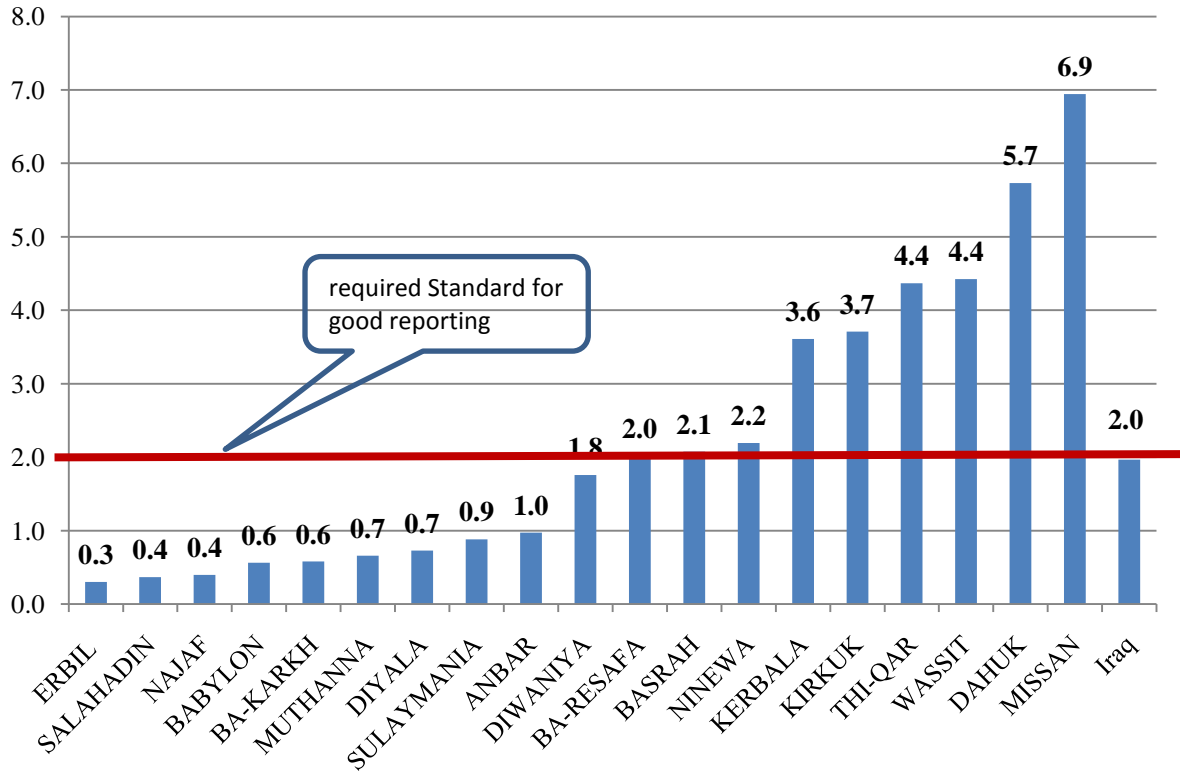

Fig (3) shows that the reporting rate is slightly below the acceptable level of 2/100,000 population in 10 DoHs.

Confirmed measles cases Iraq, all 2010 and 2011
