

A series of 6 videos explains the important steps that are being taken to make sure that, once the poliovirus has been eradicated, it will never have the opportunity to return. Although the world has never been closer to achieving the goal of polio eradication, much remains to be done.

Once wild polio has been eradicated, the only risks of the virus returning would come from rare strains of circulating vaccine derived polioviruses, and from potential leaks of the virus from laboratories or vaccine manufacturers. The 6 videos explain the work being done to address these risks.
