10 June 2020 – Somalia continues its fight against COVID-19 which has so far infected over 2300 people and killed 83. The fragile and weakened health system is being overwhelmed by demands for patient care in light of the pandemic, and Somalia has recorded the highest death toll among East African countries.

The surveillance system's ability to rapidly detect, trace, track and test cases is being challenged. In the absence of a functional disease surveillance system in the country, the Early Warning, Alert and Response Network (EWARN), established in 2008 and reactivated as a web-based electronic early warning system for disease outbreaks in 2017, has been expanded to early detect suspected cases of COVID-19 in in both primary and secondary level health care centres across the country.
