

21 February 2019 – In collaboration with local health authorities, WHO and UNICEF have concluded a nationwide measles and rubella vaccination campaign in Yemen reaching more than 11.6 million (90%) children aged 6 months–16 years across the country.

WHO, with the support of Saudi Arabia, United Arab Emirates, Kuwait and Gavi, the Vaccine Alliance, contributed to the campaign through the provision of vaccines, fuel, training, deployment of health workers and supervisors, as well as raising awareness among communities about ways to protect themselves against these diseases.

Dhamar, Mareb and Sana'a governorates have reported over 100% coverage due to a large number of internally displaced persons coming from other governorates. The campaign continued for an additional 3 days in districts where low coverage was reported.

Despite the challenging conditions, WHO teams and health workers were able to reach high-risk areas, IDP camps and marginalized communities with awareness-raising activities and vaccination.

During the measles and rubella campaign, WHO was keen to reach remote areas where IDPs are hosted to raise awareness and vaccinate them against measles and rubella given their living conditions which put them under high risk of infection from life-threatening diseases.
