

Sana'a, Aden, 5 December 2022 – Mental health disorders have increased in Yemen over the past 8 years due to the impact of conflict on people's lives, homes, communities, and livelihoods. Estimates indicate that one in 4 Yemenis, or over 5.5 million people, suffer from mental health disorders and require medical intervention.

Access to care for people with mental health disorders is incredibly challenging in Yemen. There are only 58 psychiatrists and 120 psychologists in the country as of 2020, and there are also severe shortages in other related cadres such as psychiatric nurses, social workers, and psychologists.

Through the Emergency Human Capital Project (EHCP), WHO and the World Bank are working together to provide mental health care in Yemen by expanding capacities. As part of this effort, in August and September 2022, WHO supported the local authorities to train 90 health workers on the training of trainers programme so that they could cascade knowledge and skills in mental health care to their peers.

WHO Representative to Yemen Dr Adham Rashad Ismail Abdel Moneim described the key elements of the training, "The participants learned how to recognize and address stress, trauma, psychological first aid related to humanitarian crises, loss, grief, ways to help vulnerable communities and raise community awareness on the importance of mental health care".

The 5-day training brought together participants from the authorities and civil society. To enhance equitable access and service acceptance by men and women, 60% of the participants were females. Through presentations, case scenarios, and discussions, the training focused on the provision of primary psychological services by improving diagnostic capacities and knowledge of treatment methods. The pre-and post-test scores showed a dramatic improvement in relevant knowledge, up from 30% before the training to 83% after completing the course.

One of the participants, Dr Mohammed Jumail, a specialist and therapist in Yemen's Sphere Organization and Al-Tamaninah Clinic in Sana'a, shared his impression of the training saying, "It was an honour to take part in this training among other colleagues from different institutional backgrounds. Theoretically, the course was very effective and came at the right time for us as practitioners. The cognitive enrichment was at a high level due to the professional trainer assigned to us, and we hope that practical sessions are included in the upcoming training. We took the new skills back with us to the field, to use and reflect in our mental health care practices".

In the upcoming months, WHO is planning to conduct the training of trainers course for more health workers across Yemen, and to guide the trained participants in sharing their skills and knowledge with their peers. Practical sessions and role-play components of the course will be increased in line with participants feedback. Also, there are planned training on psychological first aid, case detection, referral, and psychosocial support as well as mhGAP targeting managers, physicians, and decision-makers in national and international organizations.

Capacity-building is part of a comprehensive approach by WHO to enhance mental health care in Yemen. This work is framed by the National Mental Health Strategy for Yemen, which was launched in October 2022. To take this strategy forward, in addition to capacity-building, under EHCP, WHO is planning to rehabilitate psychiatric facilities in Aden, Taizz, and Saadah, and to establish mental health clinics across 19 EHCP-supported hospitals, as well as carrying out educative and awareness campaigns to reduce stigma around mental health.
