

A key element in achieving the United Nations Sustainable Development Goals (SDGs) and implementing universal health coverage is having appropriate, effective health policies informed by sound evidence and data. Collecting timely and high-quality evidence becomes even more crucial during health emergencies, such as the COVID-19 pandemic, which demonstrated the importance of ensuring decisions remain informed by the best available evidence in a timely manner. WHO, in collaboration with countries in the Region, developed 15 case studies in 2021–2022, to showcase diverse experiences of the use of global, regional and national data and evidence to respond to COVID-19. The countries that participated included Afghanistan, Egypt, Iran (Islamic Republic of), Jordan, Libya, Morocco, occupied Palestinian territory, Oman, Somalia, Sudan, Syrian Arab Republic and Yemen, representing a variety of country income and emergency levels.

Following completion of the case studies, the WHO Regional Office for the Eastern Mediterranean organized a two-day seminar on 26–27 October 2022, in Cairo, Egypt, to enhance the capacities of countries in the Eastern Mediterranean Region through the sharing of experiences and lessons learned from the case studies.
